                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAG80104-09 represent preferred antibodies of the invention. This sequence represents the preferred heavy chain. The humanised antibody of the invention may be used for dispensing preclinical or clinical Alzheimer's disease. The antibody specifically binds an epitope, preferably the amyloid beta peptide (Abeta). The antibodies sequester Abeta from its bound, circulating form in blood and alter clearance of soluble and bound forms of Abeta in central nervous system and plasma. The antibodies specifically bind an epitope representing amino acids 13-28 of the Abeta molecule

The invention provides human antibodies that bind to stem cell factor (SCF) protein. SCF is also known as mast cell growth factor, steel factor or c.kit ligand. Antibodies of the invention are useful for preparing compositions for treating asthma. They are also used in gene therapy. The present sequence is human SCF antibody heavy chain variable and constant region
                          New purified human antibody that binds useful for preparing a composition for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 118 GlyAspTyrTrpGlyGlnGlyThrLeuValThrValSerSerAlaSerThrLysGlyPro 137
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates a humanised antibody that specifically binds an epitope contained within positions 13-28 of amyloid beta peptide, Abeta. The antibody is useful to inhibit and reduce the formation of amyloid plaques or the effects of toxic soluble Abeta species in humans their fragments are used for the manufacture of a medicant. This includes the prolonged expression of recombinant sequences of them in human tissues syndrome or pre clinical/pre-clinical Alzheimer's disease, Down's syndrome or pre clinical cerebral amyloid angiopathy. Specifically, the antibody is used to sequester Abeta into plasma, brain or cerebrospinal fluid to prevent/revorse accumulation of the Abeta peptide within the brain thereby improving cognition. The present sequence is the heavy chain of a humanised monoclonal antibody, Hu266, based on the mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 TCCTGTGCAGCTAGCGGATTCACTTTCAGTGGCTACTGGATGTCCTGGGTCCGCCAGGCT

The invention relates to an anti-Abeta (amyloid-beta peptide) antibody 266. The antibodies are useful for treating and preventing conditions associated with the Abeta peptide, such as Alzhaimer's disease. Down syndrome, and cerebral amyloid angiopathy; for diagnosing diseases in humans; for determining whether a human subject will respond to treatment using humanized antibodies against Abeta; for treating, preventing and reversing cognitive decline in clinical or pre-clinical Alzheimer's disease, Down's syndrome or erebral amyloid angiopathy; for inhibiting formation of amyloid plaques of the effects of toxic soluble Abeta (species in humans: Treatment of the patients with antibody will inhibit or prevent cognitive decline typically associated with disease progression and reverses it. The present sequence represents a humanised anti-Abeta antibody 266 N56T heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

R;Vrana, M.; Rudikoff, S.; Potter, M.
Proc. Natl. Acad. Sci. U.S.A. 75, 1957-1961, 1978
A;Title: Sequence variation among heavy chains from inulin-binding myeloma prote A;Reference number: A93818; MUID:78158406; PMID:417344
A;Accession: C93818
A;Molecule type: protein
A;Residues: 1-113 < VRAA
C;Comment: This chain was isolated from a myeloma protein that binds inulin.
C;Superfamily: immunoglobulin v region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin homology
F;22-98/Disulfide bonds: #status predicted
                                                                                                                                                                                                                                                                                                                                           206
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CATTATGCGGAGTCTGTGAAAGGGAAGTTCACCATCTCAAGAGATGATTCCAAAAGTCGT 326

J. Immunoglobulin heavy chains from anti-inulin myeloma proteins: evidence for a new pyritie: Immunoglobulin heavy chains from anti-inulin myeloma proteins: evidence for a new pyrecession: A02073

A) Reference number: A92810; MUID:81216632; PMID:6787122

A) Accession: A02073

A) Residues: 1-113 < RUD:
C) Comment: This chain was isolated from a myeloma protein that binds inulin.
C) Comment: This chain was isolated from a myeloma protein that binds inulin.
C) Superfamily: immunoglobulin V region; immunoglobulin homology
C) Reywords: heteroterramer; immunoglobulin homology claws
F) 15-100/Domain: immunoglobulin homology claws
F) 15-100/Domain: immunoglobulin homology claws
F) 2-98/Disulfide bonds: #status predicted

Immunoglobulin heavy chains from anti-inulin myeloma proteins:
RT evidence for a new heavy chain joining segment.";
RT evidence for a new heavy chain joining segment.";
R. J. Immunol. 127.191-194(1981).
C. -! MISCELLANEOUS: THIS CHAIN WAS ISOLATED FROM A WYELOWA PROTEIN THAT BINDS INULIN.
C. -! SIMILARITY: Contains 1 immunoglobulin-like domain.
